

The new GD soup containers emphasize quality, usability, and flexible customizations. It is another premium version of the heavy-duty deli containers we have seen on the market for a long time; however, it is much more capable for what you can ever expected out of a slurpy bowl.

-Vent on Demand

You will never again have to punch a hole violently in the traditional soup lids. No shattered plastic will possibly get into the food. When you need venting, simply poke and break the Vent on the lids. (Caution hot). The vent is air-tight when it came out of the box. So, it will not sacrifice the usability of the traditional soup containers.

-Customization

Portion control inserts are available for these GD soup containers. (Sold separately) The insert sits on the upper portion of the container to create a section that is separated from the bottom portion without blocking the vent if needed. The inserts are offered in different sizes to satisfy varying applications. The combinations of different containers and inserts make the customization flexible for the needs.

-Heavy-Duty Ridged Structure.

The ridged side-wall reinforces the sturdiness of the structure; therefore, increases high temperature tolerance.

-One lids for all.

One lids size will be used to fit all the soup containers across the line.
